Strategy Description

- Tactical, all asset classes
- Low beta, absolute return, moderate growth strategy
- Uses CAMS' tactical allocation model
- Positional limits applied to high volatility sectors to reduce volatility in the portfolio
- Cornerstone's 'Flagship' portfolio

Risk Profile

The Cornerstone tactical allocation model and investment process results in, low-beta portfolios – often exhibiting strong risk-adjusted returns when compared to standard benchmarks. While Cornerstone models contain elements such as bonds as a potential choice, many positions offered in this portfolio display the highest risk/reward characteristics and investors can lose principal value if the underlying investments purchased decline in value. The portfolio management team will give consideration for reduced volatility in the portfolio and positional limits are applied to high volatility sectors (i.e. energy, gold, technology, short funds, and emerging markets). The CAMS Cornerstone Portfolio is often used for individuals that are looking to manage risk and grow investment funds for time periods longer than 7-10 years.

Portfolio Holdings on 3/31/22

- Sprott Physical Silver (PSLV)
- SPDR S&P Oil & Gas Exploration & Production (XOP)
- SPDR Utilities (XLU)
- Sprott Physical Gold (PHYS)
- Money Market

*Performance prior to 7/1/08 is shown for the CAMS Growth Portfolio which was replaced by the CAMS Growth Duo Portfolio on 7/1/08. The performance figures set forth above are compiled from actual portfolios managed by Cornerstone Asset Management Services, Inc. ("CAMS") for the time-periods shown. All managed portfolios within each of the mutual fund and variable annuity strategies were included in the performance calculation for each respective strategy. The figures were not audited or prepared by any third party. Performance is shown net of fees and calculated on a time-weighted basis. Performance also includes reinvestment of capital gains and dividends. Clients having portfolios containing securities other than those used in the strategies shown, and portfolios subject to tax, client-imposed or other restrictions would have had higher or lower returns than the performance shown. Factors such as size and performance of specific positions in accounts, length of time certain positions are held, timing of purchases and sales and deposits and withdrawals, cyclical securities price trends, favorable and unfavorable news pertaining to securities, market trends and other factors all influence performance results materially. For these reasons, actual client account performance would have only matched any performance result set out above by coincidence. The data used for this report was obtained from sources deemed reliable and then organized by the firm. Errors could have occurred in the data, in the calculations, or in the preparation of the results. Therefore, the information contained in this summary may not be precise. The results shown should not be considered indicators of future performance. There can be no assurance that any client's account performance will be favorable, or that losses will not occur, by using CAMS' recommendations or strategies. The Standard & Poor's (S&P) 500 Index is an unmanaged index that tracks the performance of 500 widely held, large-capitalization U.S. stocks. Indices are not managed and do not incur fees or expenses. It is not possible to invest directly in an index.
